To whom it may concern,

As a passionate programmer and constant learner, I endeavor to keep up with latest technology trends by learning things on demand and practicing problem solving. Spent last couple of years developing distributed client-server applications – developing API service and web applications on server side and mobile applications on client side.

After graduation, I started my career as a freelancing (upwork.com) and later joined to a Japanese company in 2016. Throughout the years worked with different technologies and gained skill and experience of solving real world problems by developing applications that meet client requirements. As a professional developer I dealt with understanding requirements, architecting, developing, testing and deploying enterprise applications.

Regarding skills, I can code in several languages and preferred languages are **C#**, **Python** and **Swift**. Regarding frameworks, I know .Net Framework and Spring Framework very well. Also used SignalR and Firebase to manage **IoT** devices for GPS tracking application using **WebSocket** protocol. I am **Big Data** and **Machine Learning** enthusiast and practicing these in my free time.

Interested to work in a professionally managed company with responsibility and challenge where I can use my knowledge and skills to provide quality solutions while enhancing my own skills with job satisfaction and scope for personal development and growth.

Kind regards,

HASSAN
